SUMMARY

Software Engineer with 3+ years of experience building distributed cloud-native systems for backup and disaster recovery of multi-cloud environments (AWS, Azure, GCP). Specialized in designing resilient microservices, recovery workflows, and high-performance APIs, with proven impact on reducing MTTR and improving system reliability at enterprise scale.

SKILLS

Languages: Java, TypeScript, JavaScript, SQL
Frontend: Angular, React, HTML, CSS, SCSS
Backend: Spring Boot, Spring Security, REST APIs
Cloud & Infra: AWS, Azure, GCP, Terraform, CloudFormation, ARM Templates
Concepts: Distributed Systems, Event-Driven Architecture, Pub/Sub
Tools: Git, GitLab, Docker, Agile/Scrum

WORK EXPERIENCE

Commvault Aug 2022 – Present
Software Engineer

- Owned backend services responsible for discovering and maintaining accurate cloud resource configurations across AWS, Azure, and GCP for enterprise customer environments.
- Architected a scalable multi-account adapter framework to normalize and validate heterogeneous cloud resources, increasing configuration coverage and visibility by **40%**.
- Built **10+** Spring Boot microservices using event-driven architecture (Pub/Sub), including recovery workflows for configuration restore, reset, and cross-subscription recovery, reducing customer **MTTR by 35%**.
- Enhanced REST APIs and data aggregation pipelines powering drift detection and recovery insights, improving response latency by **30–40%** under production workloads.
- Delivered end-to-end features across backend services, infrastructure automation, and Angular/React dashboards, collaborating with UX designers and product managers to align implementations with business needs, reducing manual setup effort by **50%** and improving troubleshooting efficiency.
- Strengthened code quality and team productivity by leading code reviews, sharing best practices, and driving knowledge transfer (KT) sessions with peers on backend design, debugging, and scalable systems.

KEY CONTRIBUTIONS

- Configuration Drift Detection:** Implemented backend workflows and UI to detect and visualize multi-cloud configuration changes, enabling faster issue identification and improved infrastructure visibility.
- Azure Database Recovery Enhancements:** Designed and implemented recovery support for Azure database services (Azure SQL Database, SQL Managed Instance), enabling restoration of stateful workloads and improving recovery coverage.
- AI-Powered Code Reviewer:** Initiated and built an AI-powered code review system integrating GitLab Merge Requests via MCP server, enabling automated inline feedback in IntelliJ IDE and reducing manual review effort by **70–80%**.

INDEPENDENT PROJECTS

- RBAC User Access Manager:** Designed secure authentication and role-based authorization using Spring Boot, JWT, and Angular.
